

Documents to be Prepared (Urgent)

1. Requirements Documentation (SRS)

Defines intended system behavior and requirements. Used to identify critical functionality, user roles, and required security controls.

2. System & Architecture Design Document (SDD)

Describes system structure and interactions. Used to identify attack surfaces, data flows, and trust boundaries.

3. Technical Specifications (TDD/LLD)

Provides implementation-level detail. Used to identify technical vulnerabilities and validate system behavior.

4. User Documentation (User Guide)

Describes how the system is used in practice. Used to identify misuse scenarios and user-related risks.

5. Security Documentation

Provides insight into the system's security posture and controls. Used to validate risks, controls, and overall security maturity.

1. Software Requirements Documentation (SRS)

Description: The Software Requirements Specification (SRS) translates high-level business needs into precise functional and non-functional technical requirements, serving as the definitive "source of truth" contract for the development team before coding begins.

Key Components:

- Executive summary
- Business context and objectives
- Project scope (in-scope and out-of-scope)
- Business requirements (functional and non-functional)
- Stakeholders and users
- Assumptions, dependencies, and constraints
- High-level business process (current vs. future state)
- High-level timeline, risks, and benefits
- Approval and sign-off

2. System and Architecture Design Document (SDD)

Description: The System and Architecture Design Document (SDD) serves as a single, comprehensive technical blueprint that bridges business needs and software development. It consolidates macro-level architectural decisions (from the HLD) and micro-level implementation specifications (from the LLD) into a definitive guide. The SDD maps high-level business goals to structured technical components, ensuring that developers, architects, and stakeholders share a unified vision before any code is written.

Sample SDD:

5. System Architecture Example

3. Low-Level Design (LLD)

Description: The Low-Level Design (LLD) document is a comprehensive technical specification that defines how each component of the system will be implemented. It translates the High-Level Design into detailed instructions for developers and engineers. LLD is developed after the HLD and before the development phase.

Key Components:

1. Introduction
 - 1.1 Purpose of the LLD Document
 - 1.1.1 In-Scope Features
 - 1.1.2 Out-of-Scope
 - 1.1.3 Assumptions and Constraints
 - 1.1.4 Audience for the Document
 - 1.2 Significance of The project
 - 1.3. System Design and Analysis
 - 1.3.1 Development Environment
 - 1.3.2 Development Tools

1.3.3 Testing Procedures

1.4 Acronyms and Definitions

2. System functionality Overview

3. Detailed Design

3.1 Use Case Diagram

Sample Use Case Diagram:

4. Use case Diagram Example

3.2 Description of the Component

3.2.1 Login Component

3.2.2 Register Admin

3.2.3 Register Internal User

3.2.4 Add Customer

3.2.5 Manage Customer Status

3.3 Class Diagram

Sample Class Diagram:

4. Class Diagram Example

3.4 Component Diagram

4. Testing

4.1 Unit Testing

4.1.2 Integration Testing

4.1.3 System Testing

4.1.4 Acceptance Testing

5. Deployment

6. Reference

4. User Manual (Documentation)

Description: The User Manual is a non-technical guide designed to help end-users understand and navigate the system efficiently. It translates complex software workflows into clear, step-by-step instructions, troubleshooting tips, and visual aids. Prepared during the late development or testing phase, this document serves as the primary reference for user onboarding, training, and daily operations, ensuring a smooth transition to the new system.

Key Components:

- Introduction and overview
- Getting started (system requirements, login/logout, first-time setup)

- Main functions / features (step-by-step instructions)
- Troubleshooting and FAQs
- Safety, security, and good practice
- Support and contacts

5. Security Documentation (UAT, Cyber Security, INSA etc.)

Description: These documents confirm that the system has passed final testing from both a business and security perspective. If INSA (Information Network Security Administration) is involved, a related security certificate is attached to show compliance with national cyber security requirements.

5.1 UAT Test Result

Key Components:

- Test scope and reference
- Test scenarios and execution summary
- Defect log reference
- Sign-off and acceptance

Documents to be Prepared (High)

1. Project Charter (PC)

- ✓ **Description:** The Project Charter is a foundational document that formally authorizes the initiation of a project. It provides a high-level overview of the project, including its objectives, scope, stakeholders, and key constraints. It is developed during the initiation phase and serves as the official approval to proceed with the project.

Key Components:

- ✓ High Level Project Structure (optional)
- ✓ Project Description
- ✓ Objectives (Purpose)
- ✓ Scope
- ✓ Project Success Criteria
- ✓ Project Requirements
- ✓ High Level Milestones

- ✓ Deliverables
- ✓ Assumptions
- ✓ Constraints
- ✓ Initial Risks
- ✓ Stakeholders
- ✓ Estimated Budget
- ✓ Project Manager Role & Authority

2. High-Level Design (HLD)

Description: The High-Level Design (HLD) document provides a macro-level view of the system architecture. It defines the overall structure, major components, and interactions without going into implementation details. HLD is prepared during the design phase, before LLD.

Key Components:

- Overall system architecture diagram
- Description of major modules/components
- Data flow and system interactions
- Integration points with external systems
- Technology stack and platform overview
- High-level security and access control approach
- Deployment architecture (servers, environments)

Documents to be Prepared (Low)

RFP, contract, updated project plan, risk register, change management, MOMs, system manual, client signoff letter, final hand over, reconciliation, LLR, archival of project records documents etc.
